

Take-Home Assignment: Ship an Updated "For Product" Landing Page for RevenueCat

Project Overview

This project simulates how we approach product marketing with a focus on scrappiness, strategic messaging, and hands-on execution. We want to understand how you think, build, and tell a compelling story.

This project should take approximately **4-6 hours** to complete.

The Challenge

The RevenueCat ["For Product Teams" landing page](#) is currently stale.

The current landing page focuses on the following use cases *"Reduce engineering time spent on maintenance & monetization changes"*, *"Reduce the complexity of supporting multiple platforms"* *"Maintain a single 'source of truth' of monetization data and reporting"* and *"Improve conversion by A/B testing with pricing, packaging, and paywalls"*. These are still relevant and important use cases for the Product Managers. However, the product has evolved meaningfully since, resulting in the need for a refreshed narrative and positioning to capture the current value of RevenueCat for Product Managers.

Your task is to **vibe-code an updated RevenueCat landing page** targeting Product Managers:

<https://www.revenuecat.com/for-product/>

The page should refresh the messaging and feature narrative to reflect the current state of RevenueCat, creating a persuasive and cohesive story that merges old and new to present RevenueCat as a complete monetization solution for PMs. Balance relevant feature education with the overall value and jobs-to-be-done (use cases) for a Product Manager.

We do not want you to create a laundry list of features or reflect all the features we've highlighted. **Use your discretion to organize and share what feels most important and compelling to lead the reader to action.**

Product Context: What's New Since the Page Was Last Updated

You will need to synthesize a narrative that incorporates relevant benefits and use cases for Product Managers into a compelling landing page. Use these as inputs for your consideration when building your story, not as a checklist.

Paywalls

RevenueCat Paywalls allow teams to remotely configure the entire paywall view without any code changes or app updates. PMs can build paywalls using a visual drag-and-drop editor, starting from templates or a blank canvas. Recent additions include AI-powered paywall generation, custom variables that let you personalize copy at runtime via the SDK, Figma export support, and a full branding system for colors and fonts. Paywalls are now generally available across iOS, Android, React Native, Flutter, and the web.

The key insight for PMs: paywall iteration no longer requires a designer, engineering sprint or an App Store review cycle.

Web-to-App Funnels

RevenueCat Funnels is a no-code visual editor for building web-to-app onboarding funnels. PMs can design multi-step screens, add branching logic based on URL parameters, survey answers, or country, connect a web checkout (RevenueCat Billing or Paddle), and publish to a hosted URL, all without touching engineering.

The end-user experience: a prospect clicks an ad, moves through a personalized onboarding flow, hits a web checkout, and receives a Redemption Link. They download the app and their subscription is already active.

Built-in analytics show conversion and drop-off at every step, with UTM tracking to tie revenue back to the campaign that generated it.

The key insight for PMs: web-to-app funnels let you capture, qualify, and convert users before they ever touch the App Store, improving attribution, reducing platform fees, and enabling faster experimentation.

Updates to Charts

RevenueCat Charts have expanded significantly. Key additions include:

- **LTV Prediction and Cohort Explorer:** Estimate future lifetime value and revenue using the Prediction Explorer. The Cohort Explorer lets you measure Revenue, Realized LTV,

or Retained Subscriptions by cohort definition and period granularity. Trial subscriptions are now included in LTV predictions.

- **Paywall Performance Charts:** Four new real-time charts break down paywall encounter rates, conversion rates, LTV by paywall, and abandonment patterns.
- **Charts API:** Programmatic access to all RevenueCat subscription analytics data (revenue, churn, active subscribers, and more) enabling teams to pull data into custom dashboards, automate reports, or connect to AI pipelines.
- **Apple Search Ads segmentation:** Filter and segment charts by ASA keyword or claim type to analyze performance at the keyword level.

The key insight for PMs: Charts are the analytical layer that connects paywall decisions, experiment results, and acquisition spend to actual business outcomes.

Web Billing

RevenueCat Billing offers web purchases designed to work seamlessly with mobile. PMs can offer subscriptions on the web via hosted Web Paywall Links or the Web SDK, complete with Stripe integration, Apple Pay and Google Pay support, multi-currency support, introductory pricing, and self-serve upgrades in the customer portal. Purchases made on the web automatically unlock in-app entitlements via Redemption Links.

The key insight for PMs: Web Billing unlocks a monetization channel that bypasses app store commissions (typically 15-30%), gives full pricing flexibility, and enables pre-launch revenue. For example, Floga generated six figures in revenue in a single day before their app was live.

Updates to Experiments

RevenueCat Experiments allow PMs to run controlled A/B tests on paywalls, pricing, and packaging. Recent updates include:

- **Multivariate testing (A/B/C/D):** Run up to four variants simultaneously to find optimal pricing, trial lengths, or paywall designs faster.
- **Predicted 12-month LTV winners:** When an experiment has enough conversion data, RevenueCat calculates the expected 12-month LTV for each variant and surfaces which one is predicted to generate more revenue over time, providing a forward-looking signal while the experiment is still running.
- **One-action winner rollout:** Stop an experiment and automatically update your offering or create a targeting rule to send all traffic to the winner in a single click.
- **Draft mode:** Set up and save an experiment before your offerings are ready, so you can plan ahead without rushing.

The key insight for PMs: Experiments are no longer just about short-term conversion rates. You can now predict long-term revenue impact and ship winners faster, with less manual work.

Notes on Audience: Product Managers

When writing for Product Managers, keep in mind their core responsibilities and the problems they face.

Enterprise and SMB Audience: This page will be visible to both enterprise product managers and those at smaller product orgs. Your messaging should be accessible and relevant to both ends of the spectrum.

Jobs-to-be-done for a Product Manager: Product Managers own user experience and product strategy. They care about aligning monetization with user value, iterating quickly without shipping constant releases, and ensuring pricing, packaging, and access control evolve alongside the product. They are typically not the ones writing billing code, but they are the ones who feel the pain when they cannot move fast.

Common pain points RevenueCat solves for PMs:

Pain Point	How RevenueCat Addresses It
Engineering bottlenecks on paywall changes	Remote paywall configuration via Paywalls (no app update required)
Experimentation uncertainty	Predicted 12-month LTV winners in Experiments
Platform policy volatility and refund abuse	Automated Refund Handler
One-size-fits-all monetization	Targeting rules engine and Web Funnels with branching logic
Blind spots in acquisition-to-revenue attribution	Funnels analytics with UTM tracking and Charts API
App store commission pressure	Web Billing with Stripe, Apple Pay, and Google Pay
Late detection of monetization issues	Paywall performance charts and LTV prediction

Deliverables

1. A vibe-coded landing page

- Functional webpage with refreshed messaging and feature narrative.
- Built using AI-assisted coding tools.
- Should target Product Managers as the primary audience.

2. A separate document detailing your AI process and any assumptions you'd like to share.

- Format of your choice (doc, Notion, Loom, etc.).
 - Cover research, ideation, iteration, and tool usage.
 - Goal is to understand your AI literacy and problem-solving approach.
-

How to Share Your Webpage

- **Option 1: Live link.** Deploy via Vercel, Netlify, or built-in hosting from your coding tool.
- **Option 2: Project link.** Share directly from tools like Replit, Bolt, or v0.

(It doesn't matter how you share it with us. As long as we can access and engage with the page.)

How You Will Be Evaluated

Visual Storytelling

Intentional layout and design that supports the narrative. The page should feel "RevenueCat-ish", demonstrating awareness of our brand without requiring exact alignment. We don't expect you to be a designer, but the page should demonstrate an understanding of visual communication skills and be palatable to an end audience.

Messaging, Positioning & Narrative

A clear, succinct narrative for Product Managers that reflects the current state of RevenueCat's capabilities. Strong information hierarchy that translates features into PM value and jobs-to-be-done. The best submissions will synthesize the features into a unified story rather than a feature list.

Confident assumptions backed by reasoning. You are encouraged to make assumptions and trade-offs in your messaging strategy. Avoid spiraling on "being right". Let us in on your thinking. We don't expect you to be an expert in the space yet.

Use of AI

Clear explanation of how AI tools were used. Evidence of iteration, learning, and pivots. Demonstrates AI fluency and problem-solving.

Recommended Tools

This is an AI-assisted assignment. You are required to use AI tools. Examples include:

- v0 by Vercel
- Bolt.new
- Replit Agent
- Cursor / GitHub Copilot
- ChatGPT / Claude / Gemini

You may use other AI-assisted tools if preferred.

Stipend for Tool Credits

- \$30 USD stipend for tool-related expenses.
 - Details shared separately.
-

Constraints

- Do not use no-code site builders (Squarespace, Wix, Webflow, etc.).
- Work must be your own.
- No outsourcing permitted.
